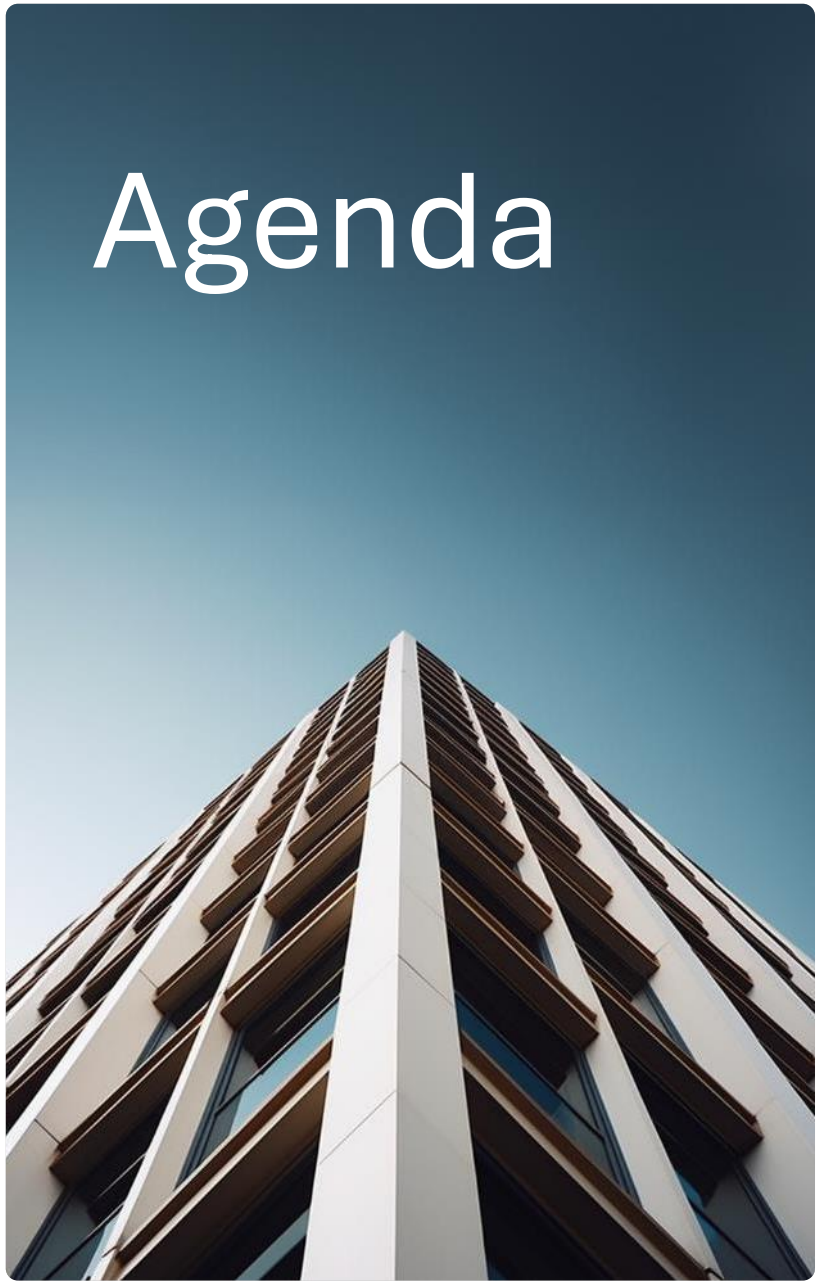
Due Diligence Report

02 April 2026



Agenda

- Objectives of Due Diligence
- Scope of Assessment
- Key Findings and Risk
- Recommendation
- Proposed Dynatrace SaaS Architecture
- Next Step & Action Plan
- Open Items and Additional information required

Objectives of Due Diligence

- Establish clear understanding of the current monitoring/observability landscape
- Identify architectural strengths, gaps, and risks in the current Dynatrace setup, including Dynatrace SaaS architecture, ActiveGate deployment, Integrations & Operational configuration
- Identify gaps in infrastructure visibility (Compute, Virtualization, Storage, Cloud, database and network dependencies) by:
  - Reviewing the current tools landscape (e.g., Dynatrace, ServiceNow, SolarWinds, Azure Monitor, vCenter tools) to understand coverage, overlap, and gaps
  - Conducting structured working sessions with key domain teams
- Assess readiness for scale, resiliency, and future integrations
- Evaluate feasibility of extending Dynatrace for infrastructure monitoring
- Recommend a scalable, resilient architecture aligned to enterprise architecture and security expectations

Scope of Assessment

- Existing Dynatrace SaaS instance (US & UK) tenancy and regional architecture
- ActiveGate deployment and network design
- Tools and platforms assessed
  - Server Infrastructure monitoring (Windows, Linux)
  - Virtualization platforms (vCenter / ESXi)
  - Cloud infrastructure Monitoring (Azure / AWS)
  - Database Monitoring
  - Network and Storage Monitoring
- Alerting, event handling, and log ingestion
- Tool integrations and ecosystem coexistence
- Scalability, resiliency, and operational challenges
- Data sources used (questionnaires, workshops, interviews)

Key Findings and Risk

- ActiveGate High Availability: The current ActiveGate deployment is not HA-enabled, resulting in a single point of failure. ActiveGates are not geographically distributed nor segmented by network zones to support resiliency.
- Scale & Capacity Misalignment: Existing ActiveGate sizing and capacity are not aligned with planned growth, particularly for extending infrastructure monitoring across onboarding on-prem hosts, vCenter/ESXi, Network devices, cloud workloads, and database monitoring. Proactive capacity planning is required prior to onboarding by deploying multiple active gates
- ITSM Integration Gap: Dynatrace is not integrated into the incident lifecycle (e.g., ServiceNow), leading to manual incident creation, delayed MTTR.
- Operational Implication: Increased operational team effort due to reliance on multiple dashboard consoles and notification channels (Email Alerts).
- Unsupported Operating Systems: Multiple server instances were identified running on operating system versions that are not compatible with Dynatrace OneAgent installation. These systems cannot be directly onboarded to Dynatrace using native OneAgent capabilities.

Recommendation

- Extend the existing US Dynatrace SaaS instance as the strategic platform for comprehensive infrastructure observability across all regions.
- Deploy additional ActiveGates across regions with network-segmented, HA design
- Use Dynatrace Extensions to monitor vCenter, Databases, Storage and network devices
- Integrate Dynatrace with ServiceNow ITOM for event correlation & suppression
- Enable Azure & AWS cloud integrations for hybrid-cloud infra monitoring
- Leverage Microsoft SCCM for automated Dynatrace OneAgent deployment on Windows servers
- Use Red Hat Satellite / Ansible for standardized OneAgent deployment on Linux platforms
- Wave-Based OneAgent Rollout Strategy. Execute OneAgent deployment in multiple waves based on:
  - Datacenters
  - Geographic regions
  - Platform types (Windows / Linux)

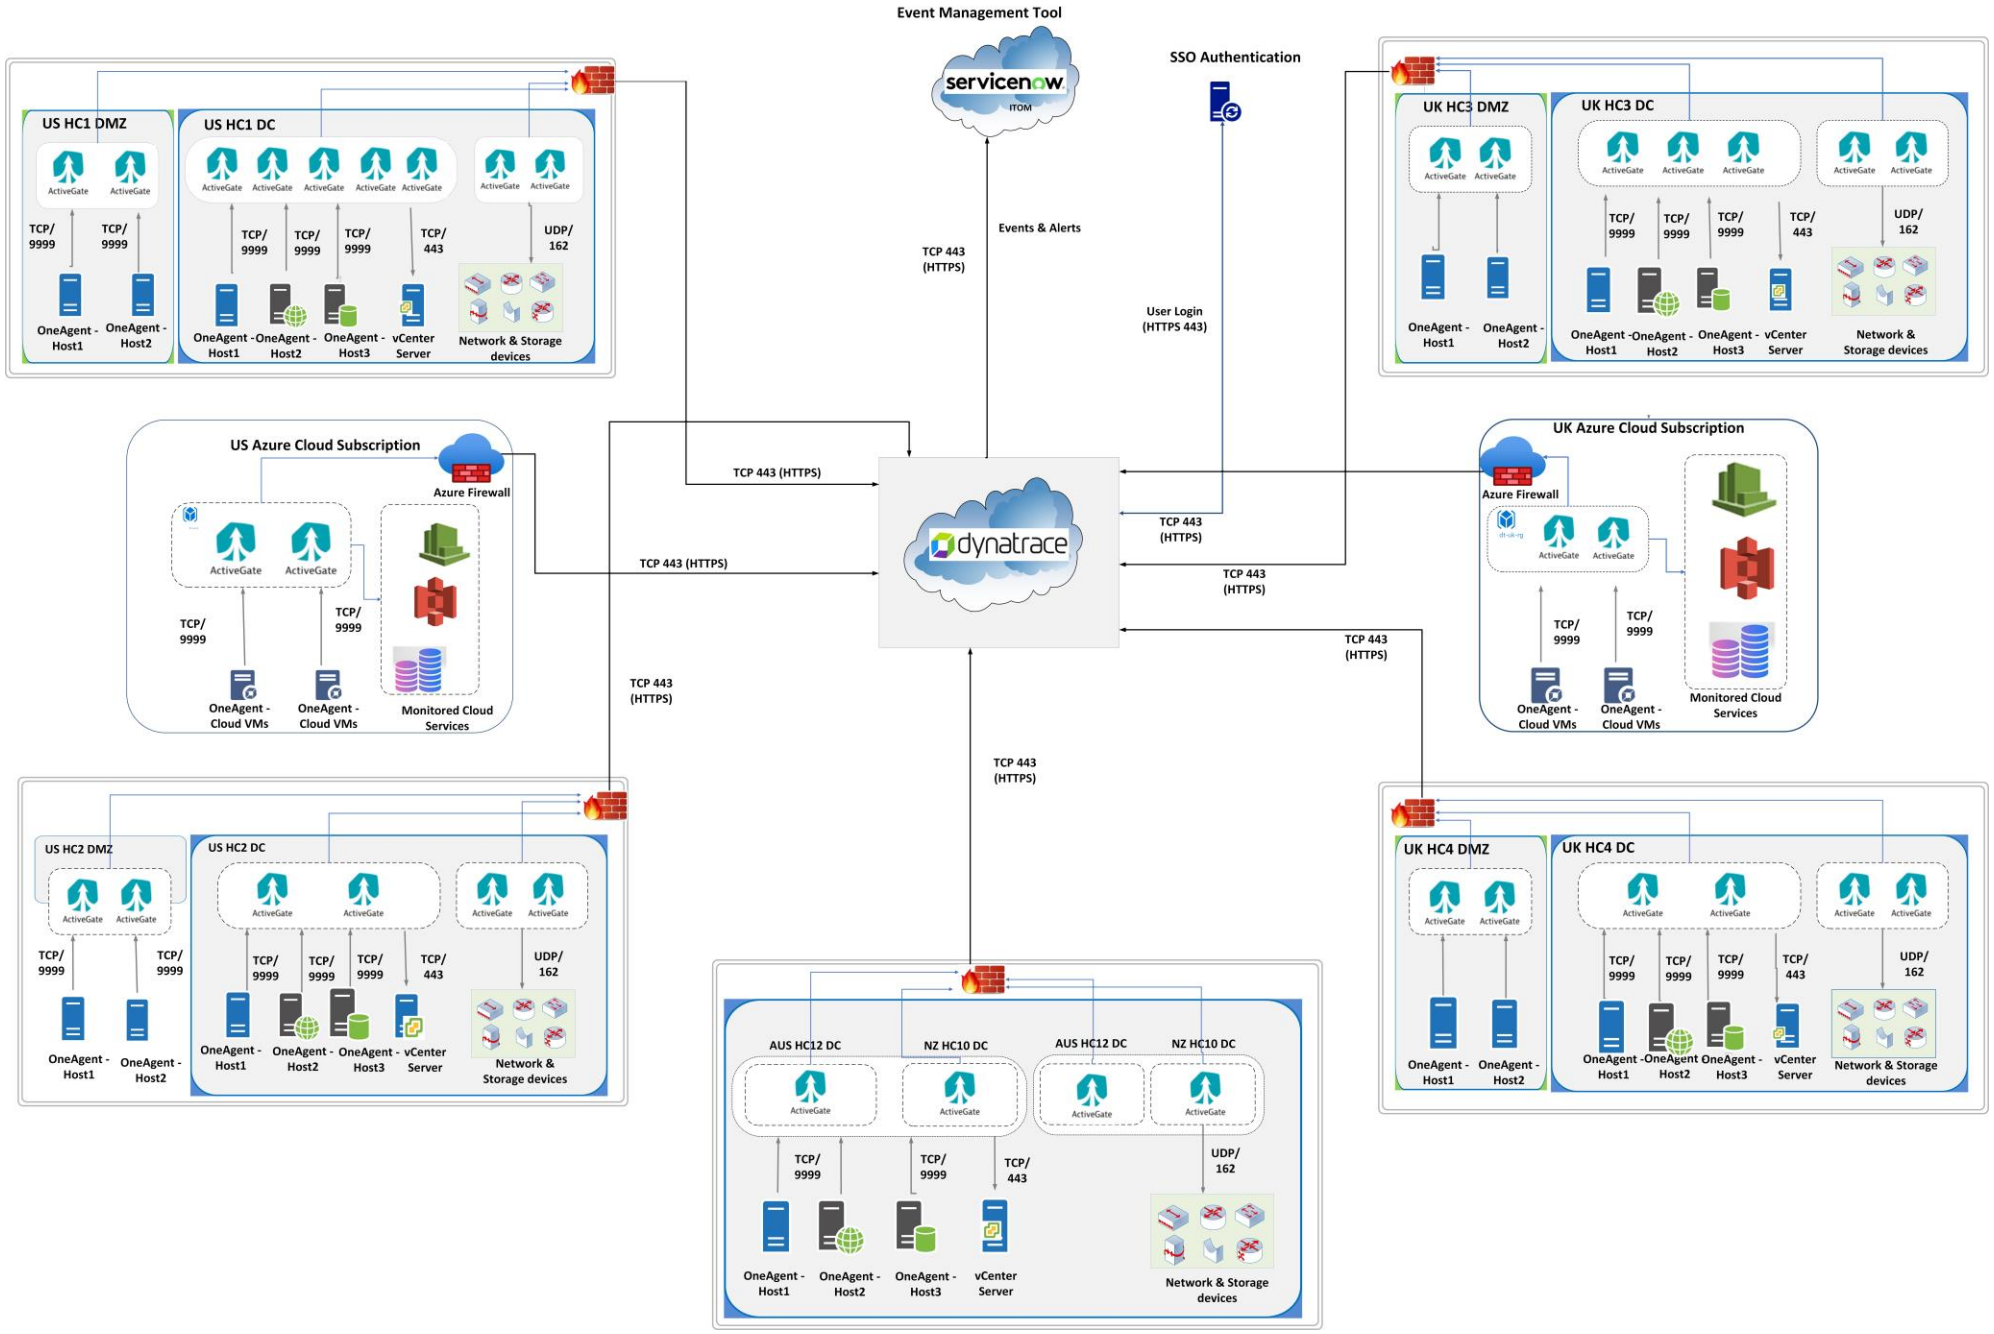
Classification: Internal

Proposed - Dynatrace SaaS Architecture



Next Steps & Action Plan

- Prepare High-Level Design (HLD) for Dynatrace Infrastructure monitoring and obtain stakeholder approval
- Raise requests to provision new VMs for ActiveGate deployments
- Deploy ActiveGates in each region as per approved, network-segmented design
- Install and configure Dynatrace extensions for:
  - vCenter
  - Network & Storage
  - Database monitoring
- Enable prerequisites and establish ServiceNow ITOM integration
- Configure integrations with Azure Monitor and AWS CloudWatch
- Prepare standardized OneAgent installation packages for:
  - Windows
  - Linux
- Raise Blanket Change Requests (CRs) for each waves and deploy OneAgent in planned rollout waves
- Enable best practices infrastructure metrics and thresholds to baseline, monitor, and optimize performance
